Plant sterols/stanols for cholesterol lowering and prevention of cardiovascular disease

Prof Dr Elke A. Trautwein, Senior Scientist Cardiovascular Health, Unilever, on behalf of the International Plant Sterols and Stanols Association (IPSSA)
International Plant Sterols and Stanols Association (IPSSA) – Introduction

- Established in 2015
- Based in and operating from Brussels, Belgium
- Founding (and current) members are leading international companies in plant sterols and stanols
  - Arboris
  - BASF
  - Cargill
  - Raisio
  - Unilever

- IPSSA covers all aspects of the plant sterols and stanols sector
  - B2B (producers of plant sterols, plant stanols, and their esters)
  - B2C (producers of foods with added plant sterols and stanols)
- IPSSA has a global focus
IPSSA - Our mission

1. To educate the **media** and the **public** about the role of a healthy diet and lifestyle in reducing the risk of heart disease

2. To demonstrate in a clear and concise manner how plant sterols and stanols have been **scientifically proven to lower blood LDL-cholesterol**

3. To inform **policymakers** and **influencers** about the safety of plant sterols and stanols as well as their efficacy in lowering blood LDL-cholesterol and thus, their contribution in reducing the risk of heart disease.
CVD is worldwide the leading cause of death in adults

In Europe, CVD accounts for 45% of all deaths*

In 2015, there were just under 11.3 million new cases of CVD in Europe and more than 85 million people were living with CVD*

CVD is a major burden on health care costs with estimated costs to the EU economy of 210 billion Euro per year

There is however compelling evidence for diet and lifestyle playing an important role in CVD prevention

With adequate changes in diet and lifestyle, at least 80% of (premature) CVD mortality may be prevented**

*European Cardiovascular Disease Statistics. 2017 Edition
Elevated serum LDL-cholesterol is a known cause of atherosclerotic cardiovascular disease (ASCVD)*

Causal relationship between LDL-cholesterol and ASCVD is supported by
- genetic studies
- epidemiological studies
- Mendelian randomisation studies
- randomized control trials

LDL-cholesterol lowering irrespective of underlying mechanisms/intervention lowers CVD risk

Lowering LDL-cholesterol: The lower the better, and the earlier the better!

*Ference et al. Eur Heart J. 2017
Plant sterols and stanols are natural compounds in the human diet

- Plant sterols and stanols are found in foods of plant origin, e.g. grains, seeds, vegetable oils, nuts, legumes, fruit and vegetables
- The term ‘phytosterols’ comprises both plant sterols and stanols
- Average daily intake with habitual diets
  - 200 to 300 mg/day of naturally occurring plant sterols
  - ~50 mg/day of naturally occurring plant stanols
  - Up to 600 mg with vegetarian/vegan-type, plant-based diet
- Plant sterols and stanols are structurally similar to cholesterol with both different side chain configurations and lack of double bonds

![Chemical structures](image)
Long history of knowing their cholesterol-lowering effect
1st human study already published in 1953*

Since mid/late 1990s, foods with added plant stanols/sterols commercially available, with wide range of different food formats and food supplements

One of the most thoroughly studied dietary ingredients
- To date >120 randomised controlled trials showing that plant sterols/stanols lower total and LDL-cholesterol without affecting HDL-cholesterol**
- Plant sterols/stanols also modestly lower triglyceride (TG) esp. in individuals with high basal TG levels***

*Pollack, Circulation 1953
**Ras et al. Br J Nutr 2014
***Rideout et al. J AOAC International 2015
Plant sterols and stanols lower cholesterol by inhibiting cholesterol absorption from the gut.

- **Dietary cholesterol**: 250-500 mg/day
- **Biliary cholesterol**: 600-1000 mg/day
- **Plant sterols/stanols**: ~2 g/day

Cholesterol absorption↓ by 30-40% ⇒ LDL-cholesterol↓
Continuous dose-response relationship of LDL-cholesterol-lowering with plant sterol/stanol intake

84 RCT with 141 strata; 6,805 study participants

114 RCT with 182 strata

Many meta-analyses summarise dose-dependent cholesterol lowering efficacy of plant sterols and stanols

Demonty et al. J Nutr 2009; Musa-Veloso et al. PLEFA 2011
Most recent evidence: Cholesterol-lowering of plant sterols and stanols across different dose ranges

Meta-analysis based on 124 RCT with 201 strata; 9,692 study participants and variety of food formats

Plant sterol/stanol intakes of 1.5 - 3 g/day dose-dependently reduce LDL-cholesterol by 7 - 12.5%

Ras et al. Br J Nutr 2014
Cholesterol lowering benefit of plant sterols and stanols demonstrated in different populations

**Meta-analysis with Familial Hypercholesterolemia (FH) patients***

*Moruisi et al. J Am Coll Nutr 2006*

**Meta-analysis with individuals with Diabetes mellitus**

LDL-C lowering: 12 mg/dL = 0.31 mmol/L (~10%)

Additive effect of combining plant sterols and stanols with statins

Meta-analysis of LDL-cholesterol effect of plant sterols/stanols in combination with statins
14 RCT (with 15 strata) with 500 participants

Plant sterols/stanols in combination with statins vs. statins alone lead to significantly stronger LDL-cholesterol reduction by 0.30 mmol/L (95% CI -0.35 to -0.25)
Additive effect of plant sterols and stanols combined with healthy diet and lipid-lowering drugs (statins)

†Low in saturated fat and dietary cholesterol
*1.5-3 g/day of plant sterols/stanols from foods with added plant sterols/stanols

Cholesterol-lowering evidence forms basis for authorised EU Health Claim for plant sterols and stanols

Authorized Disease Risk Reduction claim:

• ‘Plant sterols and plant stanol esters have been shown to lower/reduce blood cholesterol.
• High cholesterol is a risk factor in the development of coronary heart disease.’

2-step claim with focus on the risk factor

Target population for foods with added plant sterols and stanols

- Individuals who need to lower their blood cholesterol
- Not intended for use of pregnant and breastfeeding women or children under 5 years of age
- However, studies show that children with Familial Hypercholesterolemia (FH) benefit from the cholesterol-lowering efficacy of plant sterols and stanols*

EAS Consensus Panel* conclusions and recommendations

- Foods with added plant sterols/stanols up to 2 g/day are equally effective in lowering LDL-cholesterol by up to 10%
- Plant sterols/stanols can be efficaciously combined with statins

Foods with added plant sterols/stanols may be considered

- for individuals with high serum cholesterol, but intermediate or low global CVD risk who therefore do not (yet) qualify for drug treatment,
- as adjunct to drug (statin) therapy, in individuals who fail to achieve LDL-C targets or are statin-intolerant, in conjunction with other lifestyle interventions
- for adults and children (>6 yrs.) with familial hypercholesterolaemia

*Gylling et al. Atherosclerosis 2014
Catapano et al. 2016 ESC/EAS Guidelines for the management of dyslipidaemias
Eur Heart J 2016 and Atherosclerosis 2016;
Recognition for foods with added plant sterols and stanols

Acceptance and support for safety and efficacy of plant sterols and stanols as dietary option for lowering LDL-cholesterol, a major risk factor of CVD

Regulatory bodies, *e.g.*

- EU
- EFSA
- FDA
- Health Canada
- Santé Canada

Medical/scientific associations, *e.g.*

- International Atherosclerosis Society
- ESC/EAS Guidelines
- American Diabetes Association
- Academy of Nutrition and Dietetics
- JBS3
- National Lipid Association
- Canadian Cardiovascular Society
- Nederlandse Hartstichting
Conclusions

- Vast number of human intervention studies shows LDL-cholesterol lowering benefit of foods with added plant sterols and stanols
- **Intake of 1.5-3 g/day** lowers LDL-cholesterol dose-dependently by **7-12.5%**
- Plant sterols/stanols are equally effective in all food formats and in food supplements
- **Additive effect** to a heart healthy diet and to lipid-lowering medication (statins)
- **Approved health claims** by e.g. EU Commission, FDA (US), Health Canada
- Included in **recommendations** for diet and lifestyle approaches for management of dyslipidaemia as an additional adjunct to a healthy diet e.g. 2016 EAS/ESC guidelines on the management of dyslipidaemias
